

Help component description

1. **Ability to add categories in the future without significant code changes.** The component should have a flexible structure that allows adding new documentation categories without major code refactoring
2. **Automatic parsing of new content.** If instructions are added to a folder (e.g., creating a User Management folder with instructions inside), they should be automatically detected and added to the Help system without manual configuration
3. The design is approximate and can be modified to match the application's style guidelines
4. The new component should be integrated **seamlessly** with the existing project architecture. It should follow established patterns and not disrupt the current project structure
5. Different components are only visible to specific users based on their roles (worker, admin, manager). The system should NOT display guidelines for components that the user is not permitted to access.
6. Search functionality would be great to quickly find specific help topic
7. Follow collaboration.md guidelines
8. For new components ask Veronika

Responsible person: Andrii Bazanov

Deadline: 2025.03.14 (Friday)
